

Android / Mobile Developer — Kotlin Multiplatform

OBJECTIVE

Mobile developer with hands-on production experience shipping a cross-platform client (Android, iOS, Desktop) end-to-end with Kotlin Multiplatform and Compose Multiplatform — UI, architecture, state management, platform integrations, and store releases. Comfortable owning a client codebase from first screen to store listing. Looking to bring that ownership into a team, working specifically on the mobile/client side.

TECHNICAL SKILLS

Languages, UI & Architecture: Kotlin, Compose Multiplatform (Android, iOS, Desktop), Jetpack Compose, MVVM, Clean Architecture, OOP

State & Concurrency: Coroutines, Flow / StateFlow, Koin (Dependency Injection), reactive / unidirectional state management

Networking & Client Integrations: Ktor Client, kotlinx.serialization, REST API consumption, SignalR (client), JWT auth handling (token storage & refresh), Firebase Cloud Messaging, Cloudflare R2 (client-side upload/download), Sentry

Cross-Platform Tooling & Release: Xcode, CocoaPods, GitHub Actions CI/CD (cross-platform matrix builds), Git, Android keystore & signing management

App Store Distribution: Google Play Console (closed testing, AAB signing, Play App Signing), Apple App Store Connect (screenshots, export compliance, account deletion)

PROJECT EXPERIENCE

WriKi — Educational Platform for Teachers and Students — *Solo mobile/client developer, ongoing*

- Built the Android, iOS, and Desktop client from one shared Kotlin Multiplatform / Compose Multiplatform codebase, including a teacher gradebook with multi-group support, group/task management screens, and app settings.
- Resolved iOS-specific KMP integration issues (Cocoa SDK version pinning, SPM dependency resolution from Android Studio on macOS) to get Sentry crash reporting working on the iOS target.
- Tracked down and fixed a cross-platform auth bug where token loading returned an error state on both iOS and Android at once.
- Integrated real-time chat (SignalR client), push notifications (Firebase Cloud Messaging), and in-app file upload/download (Cloudflare R2).
- Owned the Android release pipeline end-to-end: keystore/signing, recovering from an accidentally committed signing key via Git history rewrite, and publishing through Google Play's closed testing track.
- Took the iOS build through Apple's App Store Connect submission — screenshots, export compliance, account deletion flow.
- Set up GitHub Actions CI/CD producing signed desktop builds (Windows, Linux, macOS) from the shared KMP codebase.

(Also designed and built the backend this client talks to — C# ASP.NET + PostgreSQL — but the focus here is the client side.)

EDUCATION

Inha University in Tashkent (IUT)

Bachelor's Degree in Computer Science (2023–2027)

SoS IT Academy

Courses: Java OOP, Kotlin, Jetpack Compose, C#, Minimal API, PostgreSQL

LANGUAGES

Uzbek — B2

Russian — B2

English — B1
